

# Home Maintenance Checklist for Fall and Winter

## General guidelines for keeping your home warm and efficient:

- Have a qualified HVAC professional inspect your home's ducts and cooling equipment.
- Set your thermostat to 68°F when you're at home and awake, and as low as 60°F when you're asleep or awake.
- Clean or replace furnace filters every month.
- Close curtains or shades at night and keep them open during the day
- Clean windows on the south side of your house to maximize sunlight exposure.
- Weather-strip doors that lead to cold or outside areas.
- Repair leaky faucets.

## Extra steps you can take to save energy:

- Install a programmable thermostat, so you can preset temperatures for different times of the day.
- Insulate the water tank and first six feet of hot and cold water pipes connected to the unit, if applicable.
- Lower the temperature of your water heater to 120°F (for every 10-degree decrease in temperature, you may save 3% - 5% on your energy costs).
- Install low-flow showerheads.

## Things you can do to improve air quality and reduce potential health risks:

- When adjusting clocks, change batteries in smoke alarms, as well as radon and carbon monoxide detectors.
- Clean water-damaged carpets and materials, or consider replacement.
- Reduce the potential for buildup of allergy-causing pollutants by keeping your house clean
- Take special precaution when operating fuel-burning appliances to avoid leakage.
- Store and dispose of household chemicals in a safe manner.
